

## Thompson Pump Multi-stage Pump

Thompson Pump promotes its multi-stage high pressure pump for the OTC show. The 5-stage diesel jet pump is a more powerful, more compact, and efficient pump for offshore applications. With a flow capacity of 1,400 gallons per minute and a shutoff head of 400 psi, this pump is ideal for offshore drilling, barge cleaning, dock and seawall installation, and pile jetting. Increased fuel tank capacity and priming capability offer longer running time and less down time, respectively. A smaller footprint takes up less barge space while easy engine startup features eliminate manual opening and closing of air valves. The discharge position is can be relocated in up to 3 positions. The Multi-stage pump is available fitted with stainless steel or bronze depending on the application requirements.
